This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

PREFACE.

THE table contained in the present volume is similar in every respect to those contained in the two preceding volumes. It gives the least factor of every number between 5,000,000 and 6,000,000, and completes the series of factor tables begun by Burckhardt and continued by Dase.

The gap of three millions between the third million and the seventh million being now filled in, the tables extend from unity to 9,000,000. The dates of publication of the nine millions are:—Second, 1814; Third, 1816; First, 1817; Seventh, 1862; Eighth, 1863; Ninth, 1865; Fourth, 1879; Fifth, 1880; Sixth, 1883.

A full description of the mode of construction of the table, and a historical account relating to factor tables and to the distribution of primes, formed part of the Introduction to the Fourth Million.

The results of the enumeration of the primes in the fourth and fifth millions were given in the Introductions to those Millions. The present Introduction contains the detailed results of the enumeration of the primes in the whole nine millions, with a comparison between the actual numbers and the values given by the various formulæ which have been proposed for the approximate representation of the numbers of primes between given limits. The concluding portion relates to the function $\mathrm{li}\, x$ and to the calculation of Riemann's formula.

JAMES GLAISHER.

INTRODUCTION.

SECTION I.

MANNER OF USING THE TABLE.

THE object of the Table is to resolve into factors any one of the million numbers lying between 5,000,000 and 6,000,000; and the Table gives directly the least factor of every number not divisible by 2, 3, or 5 between these limits.

In entering the Table, the first three figures are to be found in the spaces above the headings of the columns, the next two among the headings of the columns, and the last two in the column at the left-hand side of the page. Thus to find the least factor of 5,004,763, enter the Table with 500 47 63 (on the first page of the Table) and the tabular result is 491, showing that 491 is the least factor of the number.

In the case of prime numbers, a bar is printed as tabular result: thus, for example, 5,004,767 is a prime.

If the given number be divisible by 2, 3, or 5, it will not be found in the Table. The least factors of such numbers may be determined by inspection if they are divisible by 2 or 5, and almost by inspection if 3 is the least factor.

The first three figures of the arguments are printed in the first column of tabular results, on each page, and also whenever on the page a change occurs in these figures.

To facilitate the entry of the Table, these leading figures are also printed at the outside corner of every page, in square brackets. The number printed on each page as a heading is the first of the 9000 numbers to which the page relates; these headings are not really required, as the Table is most conveniently entered by means of the leading figures in the corner; but they are retained for the sake of uniformity with the six millions of Burckhardt and Dase.

The tables of Burckhardt, Dase, and Chernac were described in Section II. of the Introduction to the *Fourth Million.*

SECTION II.

ENUMERATION OF THE PRIME NUMBERS IN THE FIRST NINE MILLIONS.

THE enumeration was made in the following manner:—The number of primes in each group of 100 numbers, or century, was found by counting from the tables and entered in its place upon a printed form. This form contained ten lines and ten columns, so that the numbers

found by adding up the results in each column were the numbers of primes in the successive groups of 1000 numbers, and the sum of the ten numbers at the foot of the columns was the number of primes in the group of 10,000 to which the form related. I reproduce as specimens the blank form and the filled-in forms corresponding to the first two groups of 10,000.

	106		103		109		105		102		108		98		104		94		104

The first of these two tables shows that the number of primes between 0 and 100 is 26, between 100 and 200 is 21, and so on, and that the numbers of primes in the successive groups of 1000 numbers, commencing with 0, are 169, 135, &c., and that the total number of primes in the 10,000 numbers or myriad is 1230, this being the number entered at the top of the form.

The second table shows that the number of primes between 10,000 and 10,100 is 11, between 10,100 and 10,200 is 12, and so on, and that the numbers of primes in the successive groups of 1000 numbers, starting from 10,000, are 106, 103, &c., and that the total number of primes in the myriad 10,000 to 20,000 is 1033*.

The enumeration for the whole nine millions has been performed in this manner; and from the 900 tables, similar to the specimens, all the results contained in this Section, excepting only the sequences, have been derived.

The enumerations were made, and the results entered upon the forms, at least twice, and for most of the millions three times, independently. They were not only made at different times (between 1871 and 1881) and by different computers, but they have all been carefully examined since, and I feel no doubt of their accuracy. In the case of the fourth, fifth, and sixth millions the enumerations were made both from the manuscript and from the stereotype pages.

Table I. (pp. 10–27) gives the number of primes in each successive group of a thousand numbers from 0 to 9,000,000. Thus, for example, it shows that the number of primes between 0 and 1000 is 169, between 2000 and 3000 is 135, . . . between 50,000 and 51,000 is 89, and so on. Each pair of columns contains a hundred arguments corresponding to the hundred groups of 1000, which form the group of 100,000 which appears as a heading; so that, for example, between the numbers 3,364,000 and 3,365,000 there are 74 primes (p. 16). Each million occupies two pages. The results in this table are the numbers which appear at the foot of the columns in the 900 tables entered upon the printed forms; thus the first twenty results in the first million (p. 10) are the twenty numbers given at the foot of the columns in the two specimen-tables on the opposite page. The sums of the numbers forming each column of results are given at the foot of the column; these sums are therefore the numbers of primes in the groups of 50,000 to which the columns relate.

The only table similar to Table I. which has been published, occurs in the second volume of Gauss's *Werke*, and relates to the first million only. An account of this table and of other tables relating to an enumeration of the primes in the second and third millions made by Goldschmidt at Gauss's suggestion, which appear in the same volume, was given on pp. 31, 32 of the Introduction to the Fourth Million. When the nineteen errors found by Meissel and the error in the 354th chiliad, which are there referred to, are corrected, the results agree with those given on pp. 10 and 11.

Table II. (pp. 28 and 29) gives the numbers of primes in each group of 10,000 from 0 to 9,000,000, and is similar in arrangement to Table I. Thus, for example, the number of primes between 0 and 10,000 is 1230, between 10,000 and 20,000 is 1033, and so on. Each pair of columns therefore corresponds to a million numbers. The results in this table are the numbers entered at the top of each of the printed forms; thus, for example, the first result in the first million is 1230 and the second is 1033, the numbers which appear at the top of the two specimen-tables.

The results in this Table which relate to the first million and the last four millions are new. Those relating to the fourth and fifth millions have been published in the Introductions to these Millions. Similar results for the second and third millions occur in Gauss, but 45 out of the 200 numbers there given are incorrect. The Tables on pp. 30 and 31 give the numbers of primes in each group of 100,000, of 250,000, of 500,000, and of 1,000,000 respectively. Differences are added, as it is interesting to observe the fluctuations in the numbers of primes in these more extended groups. It will be noticed that not even in the table where the groups contain 500,000 numbers do the numbers of primes in the successive groups always diminish, there being an increase in one instance. The results in these tables were obtained by addition from the numbers at the foot of the columns in Table I.

* In Section VII. of the Introduction of the Fourth Million (p. 39) a similar specimen-table relating to the numbers between 3,000,000 and 3,010,000 was given.

The following four tables give the number of primes in each group of a hundred thousand, a quarter of a million, half a million, and a million from 0 to 9,000,000, with differences. It will be seen that there are thirty-four instances in which the number of primes in a group 100,000 exceeds the number in the preceding group, that there are four instances in which the number in a group of 250,000 exceeds the number in the preceding group, and that even when the group is as large as 500,000 the numbers of primes do not continually diminish, there being one instance of an increase:

NUMBER OF PRIMES IN EACH SUCCESSIVE GROUP OF 100,000, FROM 0 TO 9,000,000.

Limits.	Number of Primes.	Difference.	Limits.	Number of Primes.	Difference.
0– 100,000	9593		4,500,000–4,600,000	6493	− 120

NUMBER OF PRIMES FOR THE COMPLETE MILLIONS.

	Number of primes.	Difference.
First million	78,499	
Second „	70,433	–8066
Third „	67,885	–2548
Fourth „	66,329	–1556
Fifth „	65,369	– 960
Sixth „	64,336	–1033
Seventh „	63,799	– 537
Eighth „	63,158	– 641
Ninth „	62,760	– 398

The number of primes in the first three millions is 216,817, in the second three millions is 196,034, and in the third three millions is 189,717; the successive diminutions being 20,783 and 6317.

The total number of primes in the first million, the first two millions, the first three millions, &c., are as follows:

Limits.	Number of Primes.
0–1,000,000	78,499
0–2,000,000	148,932
0–3,000,000	216,817
0–4,000,000	283,146
0–5,000,000	348,515
0–6,000,000	412,851
0–7,000,000	476,650
0–8,000,000	539,808
0–9,000,000	602,568

In Burckhardt's tables there is no mark of any kind corresponding to the number 2,882,699, this being, no doubt, caused by the type having slipped back. This number was found to be divisible by 19. Owing to a similar accident there is nothing to show whether the number 6,036,637 in Dase's tables is a prime. This number was found to be a prime.

In all the present enumerations the numbers 1 and 2 have both been regarded as primes. Gauss gave 168 as the number of primes in the first thousand numbers, and no doubt he excluded unity. If unity be excluded, the numbers of primes in the first century, thousand, myriad, hundred thousand, and million are 25, 168, 1229, 9592, and 78,498 respectively.

Enumeration according to Numbers of Primes in Centuries.

The following ninety tables (pp. 33–55) show the number of centuries in each group of 10,000, or myriad, from 0 to 9,000,000, each of which contains no primes, the number of centuries each of which contains one prime, two primes, &c. Each table refers to 100,000 numbers, and the Roman numerals I., II., . . . X. at the head of the columns denote the first, second, . . . tenth myriad of the group. Thus the column headed I. of the first table shows that of the hundred centuries which form the group 0 to 10,000 there are two which contain each seven primes, there are three which contain each eight primes, and so on, there being one which contains twenty-six primes. Similarly the column headed II. shows that in the second myriad there is one century which contains five primes, one which contains six primes, five which contain each seven primes, and so on. The last column gives the total for the 100,000 numbers. Thus of the thousand centuries between 0 and 100,000 three contain each three primes, six contain each four primes, &c., and so on.

The number at the foot of each column is the total number of primes in the group of numbers to which the column has reference: thus between 0 and 10,000 there are 1230 primes, between 10,000 and 20,000 there are 1033, and so on. The numbers at the foot of the columns in these tables are the same as those which are given in Table II. (pp. 28 and 29), and in the table on page 30.

The tables for the fourth and fifth millions have already been published in the Introduction to these Millions.

In the second volume of Gauss's *Werke* there are given tables, similar in form to the preceding tables, for the second and third millions, and which therefore correspond to those on pp. 35–40: they were calculated by Goldschmidt, and communicated by him to Gauss. These tables are very inaccurate, the errors being so numerous that it is not worth while to give a list of them: there are, for example, no less than sixteen errors in the body of the first table (1,000,000–1,100,000). The following tables* give a comparison of the values obtained from these tables for the complete groups of 100,000 with the values found in the present enumeration:—

Second Million.		
Limits.	Number of Primes.	
	Gauss.	Pp. 35–37.
1,000,000–1,100,000	7,210	7,216
1,100,000–1,200,000	7,194	7,225
1,200,000–1,300,000	7,081	7,081
1,300,000–1,400,000	7,098	7,103
1,400,000–1,500,000	7,028	7,028
1,500,000–1,600,000	6,971	6,973
1,600,000–1,700,000	7,012	7,015
1,700,000–1,800,000	6,931	6,932
1,800,000–1,900,000	6,955	6,957
1,900,000–2,000,000	6,902	6,903
1,000,000–2,000,000	70,382	70,433

Third Million.		
Limits.	Number of Primes.	
	Gauss.	Pp. 38–40.
2,000,000–2,100,000	6,874	6,874
2,100,000–2,200,000	6,857	6,857
2,200,000–2,300,000	6,849	6,849
2,300,000–2,400,000	6,787	6,791
2,400,000–2,500,000	6,766	6,770
2,500,000–2,600,000	6,804	6,809
2,600,000–2,700,000	6,762	6,765
2,700,000–2,800,000	6,714	6,716
2,800,000–2,900,000	6,744	6,746
2,900,000–3,000,000	6,705	6,708
2,000,000–3,000,000	67,862	67,885

* 'Proceedings of the Cambridge Philosophical Society,' vol. iii. pp. 51, 52.

Tables for the complete Millions.

The following nine tables are similar in arrangement to the ninety tables on pp. 33–55; each column, except the last, relates to 100,000 numbers, and each table to 1,000,000 numbers. The numbers in the columns of the tables which relate to groups of 100,000 are the same as those headed "Total" in the preceding tables. The number of primes at the foot of each column is the number of primes in the group of 100,000 to which it relates.

The results for the nine millions are collected in a final table on p. 61, in which each column except the last relates to 1,000,000 numbers, and the last relates to the whole nine millions. It will be seen that the centuries with eight primes are the most numerous in the first million, the centuries with seven primes in the second and third millions, and the centuries with six primes in all the other millions. In the whole nine millions collectively the centuries with seven primes are the most numerous; but the numbers of six-prime and seven-prime centuries are very nearly equal. The numbers of five-prime and eight-prime centuries are also nearly equal.

It is remarkable that there should be a century in the third million containing as many as seventeen primes, and two centuries in the eighth million containing fifteen primes. These centuries are those which commence with the numbers 2,704,900, 7,133,800, and 7,587,700.

Of the first hundred thousand numbers 9·6 per cent. are primes, and of the second hundred thousand 8·4 per cent., the percentage of primes gradually diminishing to 6·3 at 9,000,000. The percentages for the different millions are 7·85, 7·04, 6·79, 6·63, 6·54, 6·43, 6·38, 6·32, and 6·28. Of the whole nine million numbers almost exactly 6·7 per cent. are primes.

Meissel determined the number of primes in the first ten millions to be 664,580, if unity be included (see p. 35 of the Introduction to the Fourth Million). Assuming this value, the number of primes in the tenth million is 62,012, and the percentage for this million is 6·20.

0 to 1,000,000.

n.	Number of centuries each of which contains *n* primes.										
	0 to 100,000.	100,000 to 200,000.	200,000 to 300,000.	300,000 to 400,000.	400,000 to 500,000.	500,000 to 600,000.	600,000 to 700,000.	700,000 to 800,000.	800,000 to 900,000.	900,000 to 1,000,000.	0 to 1,000,000.

21	1	0	0	0	0	0	0	0	0	1
26	1	0	0	0	0	0	0	0	0	1
Number of primes.	78,499	70,433	67,885	66,329	65,369	64,336	63,799	63,158	62,760	602,568

It may be remarked that this table shows that there are twenty-four centuries in the nine millions which contain no prime, and that the distribution of these centuries among the millions is:

First million	none	Sixth million	4
Second „	1	Seventh „	6
Third „	1	Eighth „	4
Fourth „	2	Ninth „	4
Fifth „	2		

The first number of each of these centuries, which consist therefore wholly of composite numbers, is given in the following list:

1,671,800	5,178,200	6,333,800	7,803,500
2,637,800	5,518,700	6,376,200	7,826,900
3,117,300	5,837,400	6,789,800	8,027,700
3,933,600	5,845,200	6,958,700	8,367,400
4,640,600	6,012,900	7,129,900	8,421,300
4,652,400	6,085,000	7,565,200	8,905,200

Sequences in the Sixth Million.

The following table contains a list of sequences of 81 and upwards occurring in the sixth million. It is exactly similar to the corresponding tables for the fourth and fifth millions, which are given respectively on pp. 46 and 10 of the Introductions to these Millions.

5,000,000 to 6,000,000.

Sequences of 81 and upwards.

Lower limit.	Upper limit.	Sequence.	Lower limit.	Upper limit.	Sequence.	Lower limit.	Upper limit.	Sequence.
5,001,809	5,001,907	97	5,377,439	5,377,529	89	5,734,357	5,734,439	81
5,014,579	5,014,663	83	5,378,731	5,378,819	87	5,752,403	5,752,489	85

5,238,581	5,238,671	89	5,608,969	5,609,053	83	5,879,869	5,879,957	87
5,257,627	5,257,711	83	5,621,513	5,621,597	83	5,888,741	5,888,873	131
5,268,299	5,268,397	97	5,623,859	5,623,949	89	5,896,843	5,896,927	83
5,268,811	5,268,899	87	5,628,157	5,628,239	81	5,914,627	5,914,717	89
5,274,463	5,274,551	87	5,639,083	5,639,167	83	5,933,903	5,933,987	83
5,314,303	5,314,391	87	5,642,099	5,642,191	91	5,940,653	5,940,743	89
5,320,501	5,320,583	81	5,646,131	5,646,229	97	5,942,777	5,942,863	85
5,321,507	5,321,593	85	5,649,221	5,649,307	85	5,950,963	5,951,051	87
5,323,949	5,324,051	101	5,651,623	5,651,707	83	5,967,347	5,967,433	85
5,332,759	5,332,841	81	5,656,837	5,656,921	83	5,976,079	5,976,181	101
5,335,189	5,335,271	81	5,671,279	5,671,361	81	5,982,413	5,982,523	109
5,337,217	5,337,307	89	5,673,449	5,673,557	107	5,989,999	5,990,081	81
5,339,903	5,339,987	83	5,695,531	5,695,619	87			
5,341,463	5,341,559	95	5,723,899	5,723,999	99			

The explanation of the table is that the 97 numbers between 5,001,809 and 5,001,907 are composite, and so on—viz. the numbers in the columns headed "Lower limit" and "Upper limit" are primes and the numbers intermediate to the lower limit and the upper limit are composite.

The four 0-prime centuries gave rise to sequences of 107, 129, 101, and 115—viz. those between 5,178,193 and 5,178,301, between 5,518,687 and 5,518,817, between 5,837,399 and 5,837,501, and between 5,845,193 and 5,845,309.

Of the double sequences only the four longest seem worth noting here: they are as follows:—of the 165 numbers between 5,102,863 and 5,103,029 one only (5,102,953) is a prime; of the 149 numbers between 5,128,063 and 5,128,213 one only (5,128,153) is a prime; of the 137 numbers between 5,438,831 and 5,438,969 one only (5,438,903) is a prime; and of the 133 numbers between 5,737,817 and 5,737,951 one only (5,737,889) is a prime.

The number of sequences of 81 and upwards given in the fourth million is 91, in the fifth million is 89, and in the sixth million is 121.

The table was formed in the manner explained on p. 44 of the Introduction to the Fourth Million. All the instances in which the enumeration showed that there were 0, 1, 2, or 3 primes in a century were looked out in the factor table, and the cases noted in which the difference between two consecutive primes exceeded 49. Afterwards the whole million was examined, independently of the enumeration for sequences of 49 and upwards. Then, finally, from the long list of sequences thus obtained, those of 81 and upwards were selected.

As in the case of the corresponding tables in the two previous millions the list is not given as being necessarily complete, though I believe it to be so. The tables were formed independently by different computers, and it seems almost impossible that any long sequences can have escaped detection.

Sequences in the Nine Millions.

The sequences of 81 and upwards for the fourth, fifth, and sixth millions were obtained in the manner that has just been explained. With regard to the other three millions, a list of sequences of 79 and upwards in the first million, and lists of sequences of 99 and upwards in the second, third, seventh, eighth, and ninth millions were published in the *Messenger of Mathematics** for 1877 and 1878. These lists were obtained by a method similar to that employed in the case of the other millions: they are not given as necessarily complete, although there can be no doubt that they are very nearly so.

The table on the next page contains a list of the sequences exceeding 100 which occur in the nine millions, those for the first three millions and the last three millions being taken from the paper just referred to, those for the fourth and fifth millions from the tables on p. 45 and p. 10 of the Introductions to these Millions respectively, and those for the sixth million from the table of sequences on the opposite page.

The table shows that the number of successions of more than a hundred composite numbers occurring in the nine millions is 148, and that their distribution among the millions is as follows:—

First million	2	Fourth million	16	Seventh million	27
Second „	11	Fifth „	16	Eighth „	23
Third „	10	Sixth „	16	Ninth „	27

* "On Long Successions of Composite Numbers," vol. vii. pp. 102–106 and 171–176.

LIST OF SEQUENCES EXCEEDING 100 OCCURRING IN THE FIRST NINE MILLIONS.

Lower limit.	Upper limit.	Sequence.	Lower limit.	Upper limit.	Sequence.	Lower limit.	Upper limit.	Sequence.

4,536,179	4,536,283	103	7,129,877	7,130,003	125	8,981,461	8,981,563	101
4,596,731	4,596,833	101						

It will be noticed that as early as 370,261 there is a sequence of 111, and that the longest sequence met with in the nine millions is 153, which occurs about the middle of the fifth million. In the sixth million there is no sequence which exceeds in length the two sequences of 131 which occur in the second million.

The following table contains the sequences exceeding 130 which occur in the nine millions, arranged in the order of their length:—

0 to 9,000,000.

Sequences exceeding 130.

Lower limit.	Upper limit.	Sequence.
4,652,353	4,652,507	153
8,421,251	8,421,403	151
2,010,733	2,010,881	147
7,230,331	7,230,479	147
6,034,247	6,034,393	145
7,621,259	7,621,399	139
8,917,523	8,917,663	139
3,826,019	3,826,157	137
7,743,233	7,743,371	137
6,371,401	6,371,537	135
6,958,667	6,958,801	133
1,357,201	1,357,333	131
1,561,919	1,562,051	131
3,933,599	3,933,731	131
5,888,741	5,888,873	131
8,001,359	8,001,491	131

The two longest sequences occurring in each of the nine millions are as follows:—

	Lower limit.	Upper limit.	Sequence.
First million	370,261	370,373	111
	492,113	492,227	113

SECTION III.

COMPARISON OF THE RESULTS OF THE ENUMERATION WITH LEGENDRE'S, TCHEBYCHEFF'S, AND RIEMANN'S FORMULÆ.

Legendre's Formula.

THE fifth section of the Introduction to the Fourth Million relates to the distribution of prime numbers, and an account is there given of the different formulæ which have been proposed for representing approximately the number of primes inferior to a given number. The present section contains the results of comparisons between the actual numbers of primes found by the enumerations described in the preceding pages and the numbers given by these formulæ.

The first formula for the approximate representation of the number of primes inferior to a given prime x was given by Legendre in the second edition (1808) of his *Essai sur la Théorie des Nombres* (Part IV. § viii. pp. 394–398). The Chapter is entitled "D'une loi très-remarquable observée dans l'énumération des nombres premiers," and commences "Quoique la suite des nombres premiers soit extrêmement irrégulière, on peut cependant trouver avec une précision très-satisfaisante, combien il y a de ces nombres depuis 1 jusqu'à une limite donnée x. La formule qui résout cette question est

$$y=\frac{x}{\log x-1\cdot08366},$$

$\log x$ étant un logarithme hyperbolique."

Legendre then gives the following table, in which the values obtained from the formula are compared with the numbers actually counted up to 400,000*:—

x.	Formula.	Tables.
10,000	1230	1230
20,000	2268	2263
30,000	3252	3246
40,000	4205	4204
50,000	5136	5134
60,000	6049	6058
70,000	6949	6936
80,000	7838	7837
90,000	8717	8713
100,000	9588	9592
150,000	13844	13849
200,000	17982	17984
250,000	22035	22045
300,000	26023	25998
350,000	29961	29977
400,000	33854	33861

The enumerations were made from the factor table and list of primes in Vega's *Tabulæ*, which extend to 400,031.

After the table Legendre remarks:—"Il est impossible qu'une formule représente plus fidèlement une série de nombres d'une aussi grande étendue et sujette nécessairement à de

* Five of the values in the "Tables" column are in error to the extent of a unit, the correct numbers being 7838, 8714, 9593, 17985, 29978.

fréquentes anomalies;" but he does not give any definite information with respect to the manner in which he was led to the formula, or to assign the value 1·08366 to the constant. He does indeed, at the end of the Chapter, indicate certain considerations from which he deduces that the average interval between two primes at the point x in the series of numbers is of the form $A \log x + B$, and thence that the number of primes inferior to x is approximately equal to

$$\frac{x}{A \log x + B - A},$$

"ce qui s'accorde avec la formule générale donnée ci-dessus, en prenant $A=1$, $B=-0{\cdot}08366$." The reasoning, however, by which the average interval is found to be of the form $A \log x + B$ is of a very vague and unsatisfactory character.

It would thus appear that Legendre, having been led by these analytical considerations, or in some other way, to a formula of the form

$$\frac{x}{A \log x - C},$$

determined the values of A and C empirically by means of the enumerations. The value of A would at once be found to be unity; and since in the table reproduced above the number of primes up to 10,000 is given as 1230 both from the formula and from the enumeration, and the two numbers are identical for no other value of x, it would seem probable that the constant was determined from the value $x=10{,}000$. This, however, cannot have been the case, for if it were so we should have

$$C = \log_e 1230 - \frac{10{,}000}{1230} = 1{\cdot}08026,$$

which differs from 1·08366 by 0·00340. Legendre's formula for $x=10{,}000$ gives 1230·51. Thus although no doubt the constant was determined mainly from $x=10{,}000$, it does not appear to have been derived from any single value of x; but it seems likely that it was so chosen as to represent as nearly as possible the results of the entire enumerations.

In 1816 Legendre published a supplement to the *Théorie des Nombres*, which contains (pp. 61, 62) an addition to the Chapter on the distribution of primes. This consists principally of the following continuation of the table from 400,000 to 1,000,000*:—

x.	Formula.	Tables.
400,000	33854	33863
500,000	41533	41538
600,000	49096	49093
700,000	56565	56535
800,000	63955	63937
900,000	71279	71268
1,000,000	78543	78493

The enumerations were made from Chernac's *Cribrum Arithmeticum*, published in 1811, which gives all the prime factors of numbers up to 1,020,000. It thus appears that when Chernac's *Cribrum* afforded Legendre the means of extending his enumerations from 400,000 to 1,000,000, he availed himself of this opportunity of further testing his formula. The values given by the formula agreed so well with the numbers counted over this extended range as to apparently confirm the value which he had assigned to the constant, and he had therefore no inducement to examine the question further or to redetermine the constant.

* The correct values of the numbers in the "Tables" column are 33861, 41539, 49099, 56544, 63952, 71275, 78499.

Taking the numbers as given by Legendre, the deviations are

x.	Deviation.	x.	Deviation.
10,000	0	200,000	− 2
20,000	5	250,000	−10
30,000	6	300,000	25
40,000	1	350,000	−16
50,000	2	400,000	− 7
60,000	− 9	500,000	− 5
70,000	13	600,000	3
80,000	1	700,000	30
90,000	4	800,000	18
100,000	− 4	900,000	11
150,000	− 5	1,000,000	50

The smallness of these deviations is very striking and, considering the great irregularities in the numbers of primes, it almost seems, as Legendre said, as if no formula could represent them better; and one can imagine how satisfactory the agreement must have appeared to him. It is remarkable that a constant which might have been determined from $x=10{,}000$ should so accurately represent the numbers of primes up to 1,000,000.

In the third edition of the *Théorie des Nombres* (2 vols., 1830) the Chapter on the distribution of primes remains substantially unaltered, but the two tables, viz. from 0 to 400,000 and from 400,000 to 1,000,000, are united in a single table *.

In the second volume of Gauss's *Werke* (1863) there is printed a letter from Gauss to Encke dated December 24, 1849. An account of the contents of this letter is given on pp. 30 and 31 of the Introduction to the Fourth Million. Gauss mentions his own researches upon the frequency of primes which date back to 1792 or 1793; and states that he soon recognized that in spite of irregularities the average frequency was approximately inversely proportional to the logarithm, so that the number of primes inferior to a given limit x was approximately expressed by

$$\int \frac{dx}{\log x},$$

the logarithm being hyperbolic. Having subsequently, with the assistance of Goldschmidt, made an enumeration of the primes up to 3,000,000, Gauss compares the numbers for each half million with the corresponding values given by the formula $\int_0^x \frac{dx}{\log x}$; and he then refers to Legendre's formula, which, he states, he had either overlooked or forgotten till Encke drew his attention to it. Gauss then compares the numbers counted and the values given by Legendre's formula, and finds the deviations to be

$$-23{\cdot}3,\quad +42{\cdot}2,\quad +68{\cdot}1,\quad +92{\cdot}8,\quad +159{\cdot}1,\quad +167{\cdot}6;$$

and he remarks that although the deviations are less than in the case of the formula $\int \frac{dx}{\log x}$, they seem to increase more rapidly. Writing Legendre's formula in the form

$$\frac{n}{\log n - A},$$

* There is a misprint in this table which does not occur in the second edition (1808), viz. the number of primes up to 300,000 is given as 25,988 instead of 25,998. In the table in the second edition (1808) the number of primes counted up to 400,000 is given as 33,861, and in the supplement (1816) as 33,863; in the table in the third edition it is given as 33 861. In forming the deviations given in the text I have taken it as 33,861.

he proceeds:—" Um Zählung und Formel in Uebereinstimmung zu bringen, müsste man respective anstatt A=1·08366 setzen

1·09040, 1·07682, 1·07582, 1·07529, 1·07179, 1·07297.

" Es scheint, dass bei wachsendem n der (Durschnitts-) Werth von A abnimmt, ob aber die Grenze beim Wachsen des n ins Unendliche 1 oder eine von 1 verschiedene Grösse sein wird, darüber wage ich keine Vermuthung."

Gauss thus determines the value of the constant by putting $x=500{,}000$, $x=1{,}000{,}000$, . . . $x=3{,}000{,}000$ in the same manner as we may suppose that Legendre determined it originally by putting $x=10{,}000$.

The enumerations employed by Gauss are, as has been pointed out on p. 55, very inaccurate; and if the correct values of the number of primes be taken, the deviations are found to be

−6·3, +44·2, +26·6, +43·8, +102·1, +95·5,

instead of those given by Gauss. The corresponding values of A are

1·08548, 1·07649, 1·08061, 1·07971, 1·07605, 1·07757.

The correct values of A do not therefore diminish so rapidly as those given by Gauss. The largest value of A is 1·085 and the least 1·076, the range being 0·009; but Gauss's largest value is 1·090 and his least 1·072, the range being 0·018 *.

Tchebycheff's Formula.

In 1848 Professor Tchebycheff communicated to the Academy of St. Petersburg a memoir, "Sur la fonction qui détermine la totalité des nombres premiers inférieurs à une limite donnée," which is referred to on p. 32 of the Introduction to the Fourth Million. He there investigates limits between which $f(x)$, the total number of primes inferior to x, must lie, and shows that when x is very large we may put approximately

$$f(x)=\int_2^x \frac{dx}{\log x}.$$

In the following year the late Mr. C. J. Hargreave published a paper in the Philosophical Magazine in which he represented the number of primes between x and x' by the formula $\int_{x'}^{x} \frac{dx}{\log x}$.

The integral $\int_0^x \frac{dx}{\log x}$ is termed the logarithm-integral, and is written li x. It thus appears that the function li x was employed by Gauss, Tchebycheff, and Hargreave independently to represent approximately the number of primes inferior to x. The first discovery is no doubt due to Gauss, but Tchebycheff was the first to publish the connexion between li x and the numbers of primes.

The logarithm-integral is defined by the equation

$$\text{li}\, x=\int_0^x \frac{dx}{\log x},$$

and therefore contains an infinite element corresponding to $x=1$ which renders the value of the integral infinite; this element is, however, supposed to be omitted, and the principal value taken. The actual formula given by Tchebycheff is li x—li 2, in which the infinite element is not included

* Assuming Gauss's values for the number of primes counted, his values of A are correctly deduced except in the case of 1,500,000, for which the value of A should be 1·07600 instead of 1·07582. It seems not improbable that Gauss's value was 1·07599, and that in writing to Encke he inadvertently copied 82, the last two figures of the previous number, instead of 99.

between the limits of integration. The value of li 2 is 1·04516 . . . ., so that if $\varphi(x)$ denote the number of primes inferior to x including unity as a prime, and $f(x)$ denote the number when unity is excluded, $\operatorname{li} x-\varphi(x)$ and $(\operatorname{li} x-\operatorname{li} 2)-f(x)$ differ from one another only by 0·045 . . . In all the tables which follow, unity is counted as a prime and the comparison is made with $\operatorname{li} x$.

Comparison of the Numbers of Primes with Legendre's and Tchebycheff's Formulæ.

Table I. (pp. 71–73) shows the numbers of primes counted for values of x differing by 50,000 up to 9,000,000, and also the corresponding values given by Legendre's formula and by the formula $\operatorname{li} x$. The deviations are shown in the next two columns, and the last column contains the differences between the values given by the two formulæ.

Table II. (pp. 74–76) shows the numbers of primes in each group of 50,000, and also the values given by each of the two formulæ for these groups. The arrangement is exactly the same as in Table I.; and indeed the results in Table II. are the differences of the results in Table I., or, conversely, Table I. may be regarded as formed by continued addition from Table II.

It may be remarked here that the numbers calculated by the formulæ and also the differences are given correctly to the nearest unit, so that there are sometimes discrepancies of a unit between the differences given and the numbers obtained by subtraction from the columns in the tables. In all cases the values derived from the formulæ were calculated to at least one decimal place, and generally to two or three, and the numbers given in the tables are those obtained by contraction from these values.

It will be seen from Table I. that up to about 5,000,000 Legendre's formula gives the better result, but that for higher values of x the deviations are less in the case of the formula $\operatorname{li} x$. Legendre's formula contains a disposable constant, which is so determined as to make the formula agree with the numbers counted when x is small; and we therefore should expect that at first Legendre's formula would give more satisfactory results than $\operatorname{li} x$. In the latter part of the table it gives a result which is considerably too large, and it is evident that, on the whole, $\operatorname{li} x$ is much the more satisfactory formula of the two.

When $x=10$, $\frac{x}{\log x-1\cdot08366}=8\cdot20$, and $\operatorname{li} x=6\cdot17$; for $x=50{,}000$, the values given by the two formulæ differ by 31; the difference then increases to about 85, from $x=1{,}050{,}000$ to $x=1{,}450{,}000$; it then decreases to zero at $x=4{,}850{,}000$; and after this the formulæ diverge continually, and differ by 174 at $x=9{,}000{,}000$. It is thus evident that comparisons between the formulæ, unless they extend beyond 5,000,000, might be very misleading *.

The last column of Table II. shows how close is the agreement between the values given by the two formulæ for ranges of 50,000. Beyond 400,000 the difference never exceeds 2. At first the formula $\operatorname{li} x$ gives the greater value; between 1,000,000 and 2,400,000 the values are identical; and for higher numbers the greater value is given by Legendre's formula.

* Tchebycheff remarks in the memoir already cited that

$$\frac{x}{\log x-1\cdot08366}-\int_2^x \frac{dx}{\log x}$$

is a minimum when

$$x=e^{\frac{(1\cdot08366)^2}{0\cdot08366}}=1{,}247{,}646,$$

but increases rapidly above this limit, and for $x=10{,}000{,}000$ is considerable, so that for this value of x the advantage of one formula over the other ought to be apparent. The difference, however, is a maximum, not a minimum, when $x=1{,}247{,}646$; and beyond this point the formulæ approach one another, and give identical results when $x=4{,}850{,}000$ nearly; it is only then that the numerical difference between them begins to increase.

TABLE I.—COMPARISON WITH LEGENDRE'S AND TCHEBYCHEFF'S FORMULÆ AT INTERVALS OF 50,000 UP TO 9,000,000.

In order to exhibit the variation in A, the constant in the formula $\frac{x}{\log x - A}$, according to the value of x by means of which A is determined, the following table was calculated. It gives, in the first column of results, the values of A as determined from $x=50{,}000$, $x=100{,}000$, . . . $x=9{,}000{,}000$. The next two columns contain the differences between the values of A and Legendre's value 1·08366, and the differences between the numbers of primes counted and the values given by Legendre's formula. The last column gives the differences in the value of A caused by a change of 1 in the number of primes counted. Thus, for example, a change of 1 in the number of primes in the first 50,000 numbers would have changed the constant, if derived from $x=50{,}000$, by 0·00190, and a change of 1 in the number of primes in the first 9,000,000 numbers would have changed it by 0·00002, if derived from $x=9{,}000{,}000$. The numbers in this column, except at the beginning of the table, are nearly equal to the quotients of the numbers in the two preceding columns.

TABLE III.—CALCULATION OF A AT INTERVALS OF 50,000 UP TO 9,000,000.

x.	A.	1·08366 −A.	Difference between number of primes and number given by Legendre's formula.	Difference in A produced by difference of 1 in number of primes counted.	x.	A.	1·08366 −A.	Difference between number of primes and number given by Legendre's formula.	Difference in A produced by difference of 1 in number of primes counted.

It will be noticed that the diminution in the value of the constant is very slow, as it only varies between 1·090 and 1·072 in the whole nine millions. The constant A is very sensitive, *i. e.* a small difference in the number of primes counted causes a considerable difference in A; and conversely, a small change in the value of A produces but little influence upon the values given by the formula, especially for the smaller values of x.

The values of A were calculated from the formula $A = \log x - \frac{x}{\varphi(x)}$, where $\varphi(x)$ denotes the number of primes inferior to x; and it may be remarked that A contains one figure less than

$\log x$ or $\frac{x}{\varphi(x)}$, a figure being lost by the subtraction. Thus, for example, if $x=250{,}000$, we have $\log x=12{\cdot}42922$, $\frac{x}{\varphi(x)}=11{\cdot}34044$; whence $A=12{\cdot}42922-11{\cdot}34044=1{\cdot}08878$; so that the seventh figure in $\log x$ or $\frac{x}{\varphi(x)}$ influences the sixth figure in the constant.

If n be the number of primes inferior to x, and if A denote the value of the constant determined from this number, and $A+h$ denote what would have been its value if the number of primes counted had been $n\pm1$ instead of n, then

$$\frac{x}{\log x-A}=n, \qquad \frac{x}{\log x-A-h}=n\pm1,$$

whence $h=\frac{\pm x}{n(n\pm1)}$. The numbers in the last column of the Table were calculated from the formula $h=\frac{x}{n^2}$.

It was shown by Tchebycheff, in his Memoir, that if $\log x-\frac{x}{\varphi(x)}$ have a limit when x is infinite, that limit must be unity. It follows therefore that if the number of primes be represented by a formula of the form $\frac{x}{\log x-A}$, the limiting value of A is unity.

If we determine A so that $\frac{x}{\log x-A}=\operatorname{li} x$, we have $A=\log x-\frac{x}{\operatorname{li} x}$.

Putting

$$\operatorname{li} x = \frac{x}{\log x}\left(1+\frac{1}{\log x}+\frac{2!}{(\log x)^2}+\frac{3!}{(\log x)^3}+\text{ \&c.}\right),$$

we have

$$\frac{x}{\operatorname{li} x}=\log x\left(1+\frac{1}{\log x}+\frac{2}{(\log x)^2}+\frac{6}{(\log x)^3}+\text{ \&c.}\right)^{-1}$$

$$=\log x-1-\frac{1}{\log x}-\frac{3}{(\log x)^2}-\frac{13}{(\log x)^3}-\frac{71}{(\log x)^4}-\text{ \&c.};$$

and therefore

$$A=1+\frac{1}{\log x}+\frac{3}{(\log x)^2}+\frac{13}{(\log x)^3}+\frac{71}{(\log x)^4}+\text{ \&c.}$$

As a first approximation we have $A=1+\frac{1}{\log x}$, the value of A being ultimately equal to unity when x is infinite, as it should be; and the formula becomes $\dfrac{x}{\log x-1-\frac{1}{\log x}}$.

The series used for $\operatorname{li} x$ is semiconvergent, and all the terms have the positive sign; but the resulting value of A can be derived without the use of this series from Theorem V. of Tchebycheff's Memoir. This Theorem is that if the function which denotes the number of primes inferior to x can be represented algebraically, up to quantities of the order $\frac{x}{(\log x)^n}$ inclusive, by means of the functions x, $\log x$, e^x, it will be represented by the formula

$$\frac{x}{\log x}+\frac{1\,.\,x}{(\log x)^2}+\frac{1\,.\,2x}{(\log x)^3}\cdots+\frac{1\,.\,2\,.\,3\ldots(n-1)x}{(\log x)^n}.$$

The use of this theorem is equivalent to that of the semiconvergent series for $\operatorname{li} x$.

It seemed worth while to calculate the values given by the formulæ

$$\frac{x}{\log x-1-\frac{1}{\log x}} \quad\text{and}\quad \frac{x}{\log x-1}$$

for the sake of comparison with those given by Legendre's formula; the results are shown in the following table:—

TABLE IV.—COMPARISON WITH $\frac{x}{\log x - 1{\cdot}08366}$, $\frac{x}{\log x - 1 - \frac{1}{\log x}}$, AND $\frac{x}{\log x - 1}$ AT INTERVALS OF 50,000 UP TO 9,000,000.

It will be noticed that, for the values of x contained in the table, the formula

$$\frac{x}{\log x - 1 - \frac{1}{\log x}}$$

is not so satisfactory as Legendre's. The values given by the formula $\frac{x}{\log x - 1}$ are very wide of the truth.

Riemann's Formula.

In 1859 Riemann communicated to the Berlin Academy a paper, "Ueber die Anzahl der Primzahlen unter einer gegebenen Grösse," which occupies pp. 136–144 of his collected works. He shows that, if $\varphi(x)$ denotes the number of primes inferior to x, then $\varphi(x)$ consists of a non-periodic function and a series of periodic terms involving the roots of a certain transcendental equation. The non-periodic function is

$$\text{li}\,(x) - \tfrac{1}{2}\,\text{li}\,(x^{\frac{1}{2}}) - \tfrac{1}{3}\,\text{li}\,(x^{\frac{1}{3}}) - \tfrac{1}{5}\,\text{li}\,(x^{\frac{1}{5}}) + \tfrac{1}{6}\,\text{li}\,(x^{\frac{1}{6}}) - \tfrac{1}{7}\,\text{li}\,(x^{\frac{1}{7}}) + \tfrac{1}{10}\,\text{li}\,(x^{\frac{1}{10}}) - \&c.,$$

where the terms are of the form $\pm\frac{1}{n}\,\text{li}\,(x^{\frac{1}{n}})$, n being a product of prime factors of the form $a\,b\,c\ldots$ (so that n contains no squared factor), and the sign being positive when the number of factors $a, b, c, \ldots$ is even, and negative when it is uneven. We may therefore represent the number of primes inferior to x approximately by the formula

$$\text{li}\,x - \tfrac{1}{2}\,\text{li}\,x^{\frac{1}{2}} - \tfrac{1}{3}\,\text{li}\,x^{\frac{1}{3}} - \tfrac{1}{5}\,\text{li}\,x^{\frac{1}{5}} + \tfrac{1}{6}\,\text{li}\,x^{\frac{1}{6}} - \&c.$$

As this formula is the only one that can be regarded as founded upon a rigorous investigation, it seemed very desirable to compare the values given by it with the numbers of primes counted, although the calculation of the formula is troublesome, both on account of the form of the arguments and the slow convergence of the terms.

I accordingly calculated the values of the formula for the same values of x as in the case of the other formulæ, and the results are contained in Table V. The corresponding values given by Legendre's and Tchebycheff's formulæ are also added for the sake of comparison.

The great superiority of Riemann's formula to the others is at once apparent; it is more accurate than Legendre's even for the smaller values of x, and it represents the numbers of primes over the whole nine millions most satisfactorily. It scarcely seems possible that a continuous formula not involving periodic terms could more accurately represent numbers which exhibit such great irregularities.

Table VI. exhibits the deviations between the numbers of primes counted and the numbers given by the five formulæ:—

(i.) Riemann's, $\text{li}\,x - \frac{1}{2}\,\text{li}\,x^{\frac{1}{2}} - \ldots$

(ii.) Tchebycheff's or Gauss's, $\text{li}\,x$.

(iii.) Legendre's, $\frac{x}{\log x - 1{\cdot}08366}$.

(iv.) $\frac{x}{\log x - 1 - \frac{1}{\log x}}$.

(v.) $\frac{x}{\log x - 1}$.

TABLE V.—COMPARISON WITH RIEMANN'S, TCHEBYCHEFF'S, AND LEGENDRE'S FORMULÆ AT INTERVALS OF 50,000 UP TO 9,000,000.

The mean deviations for the five formulæ, derived from this table, are respectively

$$-9, \quad +163, \quad +171, \quad -242, \quad -1643.$$

The diagram facing this page was constructed in order to exhibit to the eye with greater distinctness the deviations of the formulæ throughout the extent of the table. Each of the points laid down was determined as the mean of three of the values given in the table; thus the means of the numbers in the first three lines in the table are

$$-4, \quad +38, \quad -3, \quad 0, \quad -78,$$

and these are taken as the ordinates of the points corresponding to $x=100{,}000$; the means of the numbers in the next three lines are

$$+4, \quad +63, \quad +4, \quad -2, \quad -157,$$

and these are taken as the ordinates of the points corresponding to $x=250{,}000$, and so on.

The diagram shows clearly the excellence of Riemann's formula, the deviations being always small in amount and changing sign frequently. It may be remarked that, taking Meissel's value of the number of primes inferior to 10,000,000, which is given on the next page, the deviation at $x=10{,}000{,}000$ is $+87$, so that between 9,000,000 and 10,000,000 Riemann's deviation curve crosses the zero line again.

The point of intersection of Legendre's and Tchebycheff's formulæ at $x=4{,}850{,}000$ will also be noticed. Beyond this point Legendre's formula steadily diverges.

TCHEBYCHEFF
LEGENDRE
RIEMANN
$\frac{x}{\log x - 1}$
$\frac{x}{\log x - 1 - \frac{1}{\log x}}$

Number of Primes inferior to 10,000,000 *and to* 100,000,000.

In the second and third volumes of the *Mathematische Annalen* (1870 and 1871) Meissel has determined the numbers of primes inferior to 10,000,000 and to 100,000,000 by a method which is equivalent to actually counting them *, so that his numbers should be exact. Hargreave also, in the *Philosophical Magazine* for 1854, had obtained by means of a similar process the number of primes inferior to 10,000,000. In the case of 10,000,000 Meissel's number is 664,580, and Hargreave's 664,633; for 100,000,000 Meissel's number is 5,761,461. Meissel is so accurate a calculator that his results are entitled to be accepted with confidence; and taking his numbers to represent the actual numbers of primes counted, we obtain the following results:—

x.	Number of Primes.					
	Counted by	Calculated by				
	Meissel.	Riemann.	Tchebycheff.	Legendre.	$\frac{x}{\log x - 1 - \frac{1}{\log x}}$.	$\frac{x}{\log x - 1}$.
10,000,000	664,580	664,667	664,918	665,140	664,185	661,459
100,000,000	5,761,461	5,761,551	5,762,209	5,768,004	5,758,248	5,740,304

x.	Deviations of the five formulæ from the number of primes counted by Meissel.				
	Riemann.	Tchebycheff.	Legendre.	$\frac{x}{\log x - 1 - \frac{1}{\log x}}$.	$\frac{x}{\log x - 1}$.
10,000,000	+87	+338	+ 560	− 395	− 3121
100,000,000	+90	+748	+6543	−3213	−21157

The great accuracy with which Riemann's formula represents the number of primes both at 10,000,000 and 100,000,000 is very remarkable. At 100,000,000 the function li x still affords a good approximation, and its superiority to Legendre's formula, which gives a result differing widely from the truth, is very apparent; it is noticeable also that the deviation in the case of the formula $\frac{x}{\log x - 1 - \frac{1}{\log x}}$ is less than one half of that shown by Legendre's formula.

The value of the constant A determined (as in Table III.) from $x=10{,}000{,}000$ is 1·07110, and the value determined from $x=100{,}000{,}000$ is 1·06397. It thus appears that the approach of the constant towards unity is extremely slow.

On the Calculation of the Function li x.

The logarithm-integral li x, of which so much use has been made in this section, and which is so closely connected with the average distribution of primes, seems to have been first considered by Mascheroni †, although the importance of the function had been previously recognized by Euler ‡. In 1809 Soldner published at Munich a work devoted to its theory, and which

* See Introduction to the Fourth Million, pp. 34, 35.

† See *Abhandlungen von Friedrich Wilhelm Bessel*, vol. ii. (1876), p. 331, or Lacroix, *Traité des différences et des séries*, § 1117.

‡ "Videtur ergo hæc formula $\int \frac{dz}{\log z}$ singularem speciem functionum transcendentium suppeditare, quæ accuratiorem evolutionem meretur" (Institutiones Calc. Integ. vol. i. Cap. iv. § 219).

also contained a table of its values. In Zach's *Monatliche Correspondenz* for 1812 (vol. xxvi.) there is a paper by Buzengeiger upon Soldner's table and methods; and in the same year Bessel published in the *Königsberger Archiv für Naturwissenschafften und Mathematik* some investigations, both analytical and numerical, relating to the function $\operatorname{li} x$, which are reprinted in vol. ii. pp. 330–342 of his collected works.

If the function $\int_0^{e^x} \frac{du}{\log u}$ be transformed by putting $u=e^v$, it becomes$=\int_{-\infty}^{x} \frac{e^u}{u}\,du$. This integral is known by the name of the Exponential-integral, and is denoted by $\operatorname{Ei} x$, so that

$$\operatorname{li} e^x = \operatorname{Ei} x \quad \text{and} \quad \operatorname{li} x = \operatorname{Ei}(\log x).$$

The functions $\operatorname{li} x$ and $\operatorname{Ei} x$ may, however, be defined more conveniently by the formulæ

$$\operatorname{li} x = \gamma + \log(\log x) + \log x + \frac{(\log x)^2}{2!2} + \frac{(\log x)^3}{3!3} + \&c.,$$

$$\operatorname{Ei} x = \gamma + \log x + x + \frac{x^2}{2!2} + \frac{x^3}{3!3} + \frac{x^4}{4!4} + \frac{x^5}{5!5} + \&c.$$

In these series, which are always convergent, γ denotes Euler's constant 0·57721566 . . . and the terms $\log(\log x)$ and $\log x$, which occur in the series for $\operatorname{li} x$ and $\operatorname{Ei} x$ respectively, are to be understood to denote $\frac{1}{2}\log(\log x)^2$ and $\frac{1}{2}\log(x^2)$; *i. e.* it is supposed that $\log(\log x)$ and $\log x$ are not altered by a change of sign of $\log x$ and x respectively.

The integrals $\operatorname{li} x$ and $\operatorname{Ei} x$ contain infinite elements corresponding to $x=1$ and $x=0$ respectively; if the integrals be regarded as defining the functions, they are supposed to have their principal values assigned to them.

The exponential-integral is one of a group of three integrals which may be defined by the equations

$$\operatorname{Si} x = \int_0^x \frac{\sin u}{u}\,du, \quad \operatorname{Ci} x = \int_\infty^x \frac{\cos u}{u}\,du, \quad \operatorname{Ei} x = \int_{-\infty}^x \frac{e^u}{u}\,du,$$

the two former of which are termed the Sine-integral and the Cosine-integral. Changing the sign of x we find

$$\operatorname{Ei}(-x) = \int_\infty^x \frac{e^{-u}}{u}\,du.$$

The functions $\operatorname{Si} x$, $\operatorname{Ci} x$, $\operatorname{Ei} x$ have been used by Schlömilch, Arndt, and other writers as a means of expressing the values of more complicated integrals, and they are regarded as known functions.

The following is, I believe, a complete list of the tables that have been published of the functions $\operatorname{li} x$, $\operatorname{Ei}(x)$, $\operatorname{Ei}(-x)$, $\operatorname{Si} x$, and $\operatorname{Ci} x$:—

(i) 1809. SOLDNER. Théorie et tables d'une nouvelle fonction transcendante.

Table of $\operatorname{li} x$ from $x=0$ to $x=1$ at intervals of 0·01, from $x=1$ to $x=2$ at intervals of 0·1, and thence at gradually increasing intervals to $x=1280$. Throughout most of the table the number of decimals is seven, but in the latter part the number is six or five. The table is reprinted in De Morgan's 'Differential and Integral Calculus,' pp. 662–3.

(ii) 1812. BESSEL. Untersuchung der durch das Integral $\int \frac{dx}{\log x}$ ausgedrückten transcendenten Function. Abhandlungen, vol. ii. p. 339.

Values of li 1000, li 10,000, li 100,000, li 200,000, li 300,000, li 400,000, li 500,000, li 600,000, and li 1,000,000 to six or five places of decimals.

(iii) 1843. BRETSCHNEIDER. "Berechnung der Grundzahl der natürlichen Logarithmen, so wie mehrerer anderer mit ihr zusammenhängender Zahlwerthe." *Grunert's Archiv der Mathematik und Physik*, vol. iii. pp. 27–34.

Values of Si x, Ci x, Ei x, Ei $(-x)$ for $x=1, 2, 3, \ldots 10$ to twenty places of decimals. In the case of $x=1$ the values are extended to thirty-five places. The table is reprinted by Schlömilch at the end of his "Analytische Studien."

(iv) 1861. BRETSCHNEIDER. "Ueber die Berechnung der Integrallogarithmen und eniger mit ihm zusammenhängenden Functionen." *Zeitschrift für Mathematik und Physik*, vol. vi. pp. 127–139.

Values of Si x, Ci x, Ei x, Ei $(-x)$ for $x=1, 2, \ldots 10$ to twenty places of decimals, from $x=0$ to $x=1$ at intervals of 0·01, and from $x=1$ to $x=7·5$ at intervals of 0·1 to ten places.

(v) 1861–7. STENBERG. "Tabulæ logarithmi-integralis." Malmogiæ, Pars I. 1861, Pars II. 1867.

Table of li 10^x from $x=-15$ to $x=-10$ at intervals of 0·05, from $x=-10$ to $x=-7$ at intervals of 0·02, and thence to $x=+3·5$ at intervals of 0·01. As far as $x=0$ eighteen places are given, but for positive arguments the number is fifteen, fourteen, or thirteen.

(vi) 1870. GLAISHER. "Tables of the numerical values of the Sine-integral, Cosine-integral, and Exponential-integral. *Philosophical Transactions*, vol. clx. pp. 367–388.

Tables of Si x, Ci x, Ei x, Ei $(-x)$ from $x=0$ to $x=1$ at intervals of 0·01 to eighteen places of decimals, from $x=1$ to $x=5$ at intervals of 0·1, and from $x=5$ to $x=15$ at intervals of unity to eleven places, and for $x=20$ to twelve places. There are also other tables of Si x and Ci x.

It should be mentioned also that Legendre has given in vol. iii. (p. 448) of his 'Exercices de Calcul Intégral' a table of

$$\int_0^x \left(\frac{dx}{1-x}-\frac{dx}{\log\frac{1}{x}}\right)$$

from $x=0$ to $x=1$ at intervals of 0·01 to ten places of decimals; and that a paper * by Bellavitis, published in vol. xviii. (1874) of the *Memorie dell' Istituto Veneto di Scienze, Lettere ed Arti*, contains several tables connected with the logarithm-integral, the most considerable of which is a table of li $x-\log\log x-\log x$ from $x=0·5$ to $x=2·8$ at intervals of 0·01 to six places of decimals.

Considering the function in the form li e^x or Ei x, we have for the calculation of Ei x the formula proceeding in ascending powers of x which has been given above, viz.:—

$$\text{Ei}\, x=\gamma+\log x+x+\frac{x^2}{2!2}+\frac{x^3}{3!3}+\frac{x^4}{4!4}+\&c.$$

This series, though always convergent, converges rapidly only for small values of x, and the calculation is laborious for values of x exceeding, say, 5 or 10.

The descending series

$$\text{Ei}\, x=e^x\left\{\frac{1}{x}+\frac{1}{x^2}+\frac{2!}{x^3}+\frac{3!}{x^4}+\frac{4!}{x^5}+\&c.\right\}$$

is semiconvergent; and as the terms all have the same sign, it is not available for calculation as it stands, on account of the absence of a simple rule for determining sufficiently close limits to the error when a certain number of terms are retained.

* "Tavole numeriche Logaritmo-integrale ossia dell' Esponenziale-integrale e di altri Integrali Euleriani."

For calculating the value of $\mathrm{Ei}\,(x+h)-\mathrm{Ei}\,x$ we have the formula

$$\begin{aligned}\mathrm{Ei}\,(x+h)-\mathrm{Ei}\,x = {} & he^x.\frac{1}{x}\\ & +\frac{h^2}{2!}e^x\left(\frac{1}{x}-\frac{1}{x^2}\right)\\ & +\frac{h^3}{3!}e^x\left(\frac{1}{x}-\frac{2}{x^2}+\frac{2}{x^3}\right)\\ & +\frac{h^4}{4!}e^x\left(\frac{1}{x}-\frac{3}{x^2}+\frac{6}{x^3}-\frac{6}{x^4}\right)\\ & +\frac{h^5}{5!}e^x\left(\frac{1}{x}-\frac{4}{x^2}+\frac{12}{x^3}-\frac{24}{x^4}+\frac{24}{x^5}\right)\\ & +\frac{h^6}{6!}e^x\left(\frac{1}{x}-\frac{5}{x^2}+\frac{20}{x^3}-\frac{60}{x^4}+\frac{120}{x^5}-\frac{120}{x^6}\right)\\ & +\frac{h^7}{7!}e^x\left(\frac{1}{x}-\frac{6}{x^2}+\frac{30}{x^3}-\frac{120}{x^4}+\frac{360}{x^5}-\frac{720}{x^6}+\frac{720}{x^7}\right)\\ & +\frac{h^8}{8!}e^x\left(\frac{1}{x}-\frac{7}{x^2}+\frac{42}{x^3}-\frac{210}{x^4}+\frac{840}{x^5}-\frac{2520}{x^6}+\frac{5040}{x^7}-\frac{5040}{x^8}\right)\\ & +\&c.\end{aligned}$$

The law of the coefficients in the successive terms is evident: thus, *ex. gr.*, in the term involving h^7, the successive coefficients are obtained by multiplying the previous ones by 6, 5, 4, 3, 2, 1 respectively; in the term involving h^8 by multiplying them by 7, 6, 5, 4, 2, 1 and so on.

As this formula is given by Taylor's theorem, the error when we stop at any term must be equal to the value of the next term when x is replaced by $x+\theta x$, θ being a proper fraction.

The sum of the first terms in the expressions involving successive powers of h is

$$e^x\frac{e^h-1}{x};$$

and we may therefore write the formula in the form

$$\begin{aligned}\mathrm{li}\,e^{x+h}-\mathrm{li}\,e^x = {} & \frac{e^{x+h}-e^x}{x}-\frac{h^2}{2!}e^x\frac{1}{x^2}\\ & -\frac{h^3}{3!}e^x\left(\frac{2}{x^2}-\frac{2}{x^3}\right)\\ & -\frac{h^4}{4!}e^x\left(\frac{3}{x^2}-\frac{6}{x^3}+\frac{6}{x^4}\right)\\ & -\&c \quad\ldots\ldots\ldots\ldots\ldots \quad (1)\end{aligned}$$

The values of $\mathrm{li}\,x$ required for Table I. (pp. 71–73) were calculated by this formula as follows:—

Putting $e^x=y$ and $e^{x+h}=y+k$, so that

$$\mathrm{li}\,e^{x+h}=\mathrm{li}\,(y+k), \quad \mathrm{li}\,e^x=\mathrm{li}\,y,$$

we find that, if y and k are any two quantities, and if we put

$$\log_e y=\mathrm{Y},$$

and

$$\log_e(y+k)-\log_e y=\log_e\left(1+\frac{k}{y}\right)=\mathrm{Y}',$$

then

$$\begin{aligned}\mathrm{li}\,(y+k)-\mathrm{li}\,y=&\frac{k}{\mathrm{Y}}-\frac{y}{2}\frac{\mathrm{Y}'^2}{\mathrm{Y}^2}\\&-\frac{y}{3}\frac{\mathrm{Y}'^3}{\mathrm{Y}^2}+\frac{y}{3}\frac{\mathrm{Y}'^3}{\mathrm{Y}^3}\\&-\frac{y}{8}\frac{\mathrm{Y}'^4}{\mathrm{Y}^2}+\frac{y}{4}\frac{\mathrm{Y}'^4}{\mathrm{Y}^3}-\frac{y}{4}\frac{\mathrm{Y}'^4}{\mathrm{Y}^4}\\&-\&\mathrm{c.}\quad\ldots\ldots\ldots\ldots\ldots\ldots\quad(2)\end{aligned}$$

In calculating Table I. k was taken=50,000. I began the table at 500,000, and calculated the values of the differences by this formula from 500,000 to 9,000,000. The values of Y ranged from 13·12 to 16·01, and those of Y′ (the difference between two consecutive Y's) from 0·095 to 0·006. The work was carried to three decimal places; and putting successively y=500,000, y=550,000, ... y=8,950,000 it was found that

li 550,000 − li 500,000 = 3796·300,
li 600,000 − li 550,000 = 3770·240,
. . . . . .
li 8,950,000 − li 8,900,000 = 3124·148,
li 9,000,000 − li 8,950,000 = 3123·057.

The value of li 500,000 was obtained by an independent calculation and found to be 41606·289 (see pp. 94, 95); by adding repeatedly to this quantity the differences calculated by the formula (2), the values of li 550,000 &c. were obtained, viz.:

li 550,000 = 45402·589,
li 600,000 = 49172·829,
. . . . .
li 8,900,000 = 596429·070,
li 8,950,000 = 599553·218,
li 9,000,000 = 602676·275.

An independent calculation was made of li 8,900,000, and the value found to be 596429·049, which differs from the value obtained by successive addition of the differences by only 0·021. The value of li 3,250,000 was also calculated independently and found to be 233687·782, the value obtained by the successive additions being 233687·789, which differs from it by 0·007.

As the results in Table I. were required to be correct only to the nearest unit, their accuracy was thus amply verified by the agreement of the values of li 3,250,000 and of li 8,900,000 with those calculated independently. The values of the differences as calculated by the formula (2) were, however, differenced as an additional verification.

It may be mentioned that the values found for li 2,000,000 − li 1,000,000 and li 3,000,000 − li 2,000,000 were respectively 70427·279 and 67935·739; these are confirmed by Gauss's values, which are 70427·78 and 67915·733 (*Werke*, vol. ii. p. 443).

The values of li x for values of x less than 500,000 were calculated in the same manner by means of the formula (2), though it was of course necessary to include more terms. Bessel in the table referred to on p. 90 gave the values of li x for x=100,000, 200,000, 300,000, and 400,000; and the agreement of these results with those deduced by the formula (1) from the value for x=500,000 to the required degree of accuracy was a sufficient verification. As an additional verification the value of li 50,000 was deduced independently from the value of Ei (11) given in the table (vi) referred to on p. 91; it was also calculated by the series proceeding by ascending powers of x. The value was thus found to be 5166·55.

I reproduce from p. 339 of vol. ii. of Bessel's 'Abhandlungen' the table

$$\begin{aligned}
\text{li } 1000 &= 177{\cdot}609658 \\
\text{li } 10{,}000 &= 1246{\cdot}137249 \\
\text{li } 100{,}000 &= 9629{\cdot}80904 \\
\text{li } 200{,}000 &= 18036{\cdot}05216 \\
\text{li } 300{,}000 &= 26086{\cdot}69223 \\
\text{li } 400{,}000 &= 33922{\cdot}62200 \\
\text{li } 500{,}000 &= 41606{\cdot}40507^{*} \\
\text{li } 600{,}000 &= 49172{\cdot}82711 \\
\text{li } 1{,}000{,}000 &= 78627{\cdot}54928
\end{aligned}$$

and from the Philosophical Transactions, vol. clx. pp. 384 and 386, the table

$$\begin{aligned}
\text{Ei } (1) &= 1{\cdot}895\ 117\ 816\ 36 \\
\text{Ei } (2) &= 4{\cdot}954\ 234\ 356\ 00 \\
\text{Ei } (3) &= 9{\cdot}933\ 832\ 570\ 62 \\
\text{Ei } (4) &= 19{\cdot}630\ 874\ 470\ 06 \\
\text{Ei } (5) &= 40{\cdot}185\ 275\ 358\ 80 \\
\text{Ei } (6) &= 85{\cdot}989\ 762\ 142\ 44 \\
\text{Ei } (7) &= 191{\cdot}504\ 743\ 335\ 50 \\
\text{Ei } (8) &= 440{\cdot}379\ 899\ 534\ 84 \\
\text{Ei } (9) &= 1037{\cdot}878\ 290\ 717\ 09 \\
\text{Ei } (10) &= 2492{\cdot}228\ 976\ 241\ 88 \\
\text{Ei } (11) &= 6071{\cdot}406\ 374\ 098\ 61 \\
\text{Ei } (12) &= 14959{\cdot}532\ 666\ 397\ 53 \\
\text{Ei } (13) &= 37197{\cdot}688\ 490\ 689\ 03 \\
\text{Ei } (14) &= 93192{\cdot}513\ 633\ 965\ 37 \\
\text{Ei } (15) &= 234955{\cdot}852\ 490\ 768\ 32
\end{aligned}$$

to which may be added

$$\text{Ei } (20) = 25615652{\cdot}664\ 056\ 588\ 820$$

given on p. 371 of the same paper.

It will be noticed that the value of Ei 13 does not differ greatly from that of li 500,000; and as the latter was to be used as a fundamental quantity in the calculation of the values of li x for Table I., it seemed desirable to obtain an independent calculation of its value to several places of decimals by deducing it from Ei 13.

Changing the sign of h in the formula (1), and putting

$$e^x = 500{,}000 \text{ so that } x = \log_e 500{,}000,$$

and

$$x - h = 13,$$

we find from (1)

$$\text{li } 500{,}000 - \text{Ei } 13 = \frac{e^x - e^{x-h}}{x} + \frac{h^2}{2!}\frac{e^x}{x^2} - \frac{h^3}{3!}e^x\left(\frac{2}{x^2} - \frac{2}{x^3}\right) + \&c.,$$

where

$$x = 13{\cdot}122\ 363\ 377\ 4, \qquad h = 0{\cdot}122\ 363\ 377\ 4;$$

* This value of li 500,000 should be 41606·28879; see opposite page.

and including terms as far as h^7 it was thus found that

$$\text{li}\,500{,}000 - \text{Ei}\,13 = 4408{\cdot}600\ 295\ 8,$$

the last figure not necessarily being exact.

Since Ei 13=37197·6884907, we thus find

$$\text{li}\,500{,}000 = 41606{\cdot}288\ 786\ 5,$$

which differs from Bessel's value 41606·40507 by 0·11628.

To verify that no error had been made in the calculation of the difference li 500,000−Ei 13 another determination was made, also by means of the formula (1), taking

$$e^{x+h} = 500{,}000 \text{ and } x = 13,$$

so that in this case

$$x = 13, \quad h = 0{\cdot}122\ 363\ 377\ 4,$$

and the resulting value of the difference was found to be 4408·600 295 8, agreeing exactly with the preceding value.

If therefore the value of Ei 13 was correct, it followed that Bessel's value of li 500,000 was erroneous.

The value of the difference Ei 13 − li 400,000 was also calculated by means of the formula (1), putting

$$x = 13, \qquad e^{x-h} = 400{,}000,$$

whence

$$h = 0{\cdot}100\ 780\ 173\ 9.$$

The value was thus found to be 3275·066 565 3; and subtracting this from the value of Ei 13 we find

$$\text{li}\,400{,}000 = 33922{\cdot}621\ 925\ 4,$$

which differs from Bessel's value by only 0·00007. We thus obtain, therefore, a verification of the accuracy of the values of Ei 13 and li 400,000.

Since

$$\text{li}\,500{,}000 - \text{Ei}\,13 = 4408{\cdot}600\ 295\ 8,$$

and

$$\text{Ei}\,13 - \text{li}\,400{,}000 = 3275{\cdot}066\ 565\ 3,$$

it follows by addition that

$$\text{li}\,500{,}000 - \text{li}\,400{,}000 = 7683{\cdot}666\ 861\ 1.$$

As an additional verification the value of this difference was calculated independently from the formula (1), putting

$$e^x = 500{,}000, \qquad e^{x-h} = 400{,}000,$$

whence

$$h = 0{\cdot}223\ 143\ 551\ 3.$$

The value was found to be 7683·666 860 9, which differs from that obtained above by only 2 in the last figure.

The value of li 600,000 − li 500,000 was also calculated in two ways by the formula (1), viz. both by putting

$$e^x = 600{,}000, \quad e^{x-h} = 500{,}000,$$

and by putting

$$e^x = 500{,}000, \quad e^{x+h} = 600{,}000,$$

the value of h in both cases being 0·182 321 556 8.

The two calculations gave as the value of the difference

$$7566{\cdot}538\ 199\ 8 \quad \text{and} \quad 7565{\cdot}538\ 199\ 7$$

respectively.

The resulting values thus found for li 400,000 &c. are

$$\begin{aligned} \text{li}\,400{,}000 &= 33922{\cdot}621\ 925\ 4, \\ \text{li}\,500{,}000 &= 41606{\cdot}288\ 786\ 5, \\ \text{li}\,600{,}000 &= 49172{\cdot}826\ 986\ 2, \end{aligned}$$

in which the last figure of li 600,000 is either a 2 or 3 according to which of the two values of the difference li 600,000 − li 500,000 is taken. These values are, however, not necessarily correct to the last figure; but, from the close agreement of the results derived from the different calculations, it is probable that the last figures are not much in error. Bessel's values, which are given to only five places of decimals, differ from them by 0·00007, 0·11628, and 0·00012 respectively.

In connexion with Bessel's table, the following calculations, which were undertaken with reference to Table I., may be noticed here.

The value of li 250,000 − li 200,000 was calculated, taking $e^x = 200{,}000$, and found to be 4057·9625274; and the value of li 300,000 − li 250,000 was also calculated, taking $e^x = 300{,}000$, and found to be 3992·6775419. Adding these differences we find

$$\text{li}\,300{,}000 - \text{li}\,200{,}000 = 8050{\cdot}640\ 069\ 3.$$

From Bessel's values of li 200,000 and li 300,000, which extend to five places of decimals, we find by subtraction

$$\text{li}\,300{,}000 - \text{li}\,200{,}000 = 8050{\cdot}64007,$$

agreeing with the previous value to the last figure. Taking, therefore, Bessel's value of li 200,000 or li 300,000, we find

$$\text{li}\,250{,}000 = 22094{\cdot}01469,$$

which is therefore certainly correct*.

It should be mentioned that Bessel's values of li 100,000 and li 200,000 were indirectly verified by Gauss, who determined, as an example of his method of approximating to the values of integrals†, the value of li 200,000 − li 100,000. Gauss found as his result 8406·2431211; and by subtracting Bessel's value of li 100,000 from his value of li 200,000 we obtain the difference 8406·24312, agreeing with Gauss's value to the last figure.

As mentioned on p. 93, it was necessary, in order to verify Table II., to make an independent determination of the value of li x, for some value of x near to the limit of the extent of the table. For this purpose the value of Ei 16 was calculated by means of the series proceeding by ascending powers of x, and the value of li 8,900,000 was deduced from it by means of the formula (1).

By actually performing the operations of multiplication and division, it was found that

$$16 + \frac{16^3}{3!3} + \frac{16^5}{5!5} + \frac{16^7}{7!7} \ldots + \frac{16^{57}}{57!57} = 297780{\cdot}499\ 335\ 421\ 7,$$

$$\gamma + \log_e 16 + \frac{16^2}{2!2} + \frac{16^4}{4!4} \ldots + \frac{16^{56}}{56!56} = 297780{\cdot}499\ 335\ 414\ 9,$$

* On p. 327 of vol. ii. of the *Abhandlungen* Bessel has given the value of li 200,000 to six places of decimals, and, using this value, we find li 250,000 = 22094·014686.

† *Werke*, vol. iii. p. 196.

giving, by addition and subtraction,

$$\begin{aligned} \text{Ei}\,16 &= 595560{\cdot}998\ 670\ 836\ 6, \\ \text{Ei}\,(-16) &= -\quad {\cdot}000\ 000\ 006\ 8. \end{aligned}$$

Calculating Ei (-16) by the formula

$$\text{Ei}\,(-x) = -e^{-x}\left\{\frac{1}{x} - \frac{1}{x^2} + \frac{2!}{x^3} - \frac{3!}{x^4} + \&c.\right\},$$

we find

$$\text{Ei}\,(-16) = -0{\cdot}000\ 000\ 006\ 6,$$

which differs from the value of Ei (-16) found by the ascending series by only 2 in the last place. This affords a verification of the whole calculation; and the result

$$\text{Ei}\,16 = 595560{\cdot}998\ 670\ 836\ 6$$

is therefore verified, except as regards the last figure.

The value of Ei 16 − li 8,900,000 was calculated by means of the formula (1), putting $x=16$, and found to be 868·0502, whence it follows that

$$\text{li}\,8{,}900{,}000 = 596429{\cdot}0489.$$

This value, as already mentioned on p. 93, differed by only 0·021 from that found by adding up continually the differences for each group of 50,000, starting with li 500,000; and this agreement afforded a sufficient verification of the accuracy of the table so formed.

The independent calculation of li 3,250,000 referred to on p. 93 was made by calculating the difference between its value and that of Ei (15) given in the table quoted on p. 94 from the Philosophical Transactions. Putting

$$x=15, \qquad e^{x-h}=3{,}250{,}000,$$

the value of h is 0·0058344, and the value of the difference was found to be 1268·071, giving

$$\text{li}\,3{,}250{,}000 = 233687{\cdot}782,$$

which differs from the value found in the calculation of Table I. by only 0·007.

The values of li 10,000,000 and li 100,000,000 were calculated in the following manner by means of formulæ given by Bessel (*Abhandlungen*, vol. ii. p. 338).

Bessel has there shown that

$$\begin{aligned} \text{li}\,a^m = \text{li}\,a^{m-r} &+ \text{B}'\left\{\frac{a^m}{m} + \frac{a^{m-1}}{m-1} + \frac{a^{m-2}}{m-2} \cdots + \frac{a^{m-r+1}}{m-r+1}\right\} \\ &+ \text{B}''\left\{\frac{a^m}{m^2} + \frac{a^{m-1}}{(m-1)^2} + \frac{a^{m-2}}{(m-2)^2} \cdots + \frac{a^{m-r+1}}{(m-r+1)^2}\right\} \\ &+ \text{B}'''\left\{\frac{a^m}{m^3} + \frac{a^{m-1}}{(m-1)^3} + \frac{a^{m-2}}{(m-2)^3} \cdots + \frac{a^{m-r+1}}{(m-r+1)^3}\right\} \\ &+ \ldots\ldots; \end{aligned}$$

and for the case $a=10$ he has given a table of the values of the coefficients B′, B″. . . . . This table contains the value of $n\text{B}^{(n)}$ to eleven places of decimals and of $\log_{10}\text{B}^{(n)}$ to ten places as far as $n=29$.

In the case $r=1$, the formula becomes

$$\text{li}\, a^m = \text{li}\, a^{m-1} + B' \frac{a^m}{m} + B'' \frac{a^m}{m^3} + B''' \frac{a^m}{m^5} + \&c.,$$

from which, putting $m=7$ and $m=8$, and working to two places of decimals, we obtain

$$\text{li}\, 10^7 - \text{li}\, 10^6 = 586{,}290{\cdot}85,$$
$$\text{li}\, 10^8 - \text{li}\, 10^7 = 5{,}097{,}290{\cdot}98.$$

Since $\text{li}\, 10^6 = \text{li}\, 1{,}000{,}000 = 78627{\cdot}55$, we thus find

$$\text{li}\ 10{,}000{,}000 = 664{,}918{\cdot}40,$$
$$\text{li}\, 100{,}000{,}000 = 5{,}762{,}209{\cdot}38,$$

in which results of course the last figure is not necessarily correct.

As a verification the value of li 10,000,000 was deduced from Ei 16 by means of the formula (1). Taking $x=16$, the difference was found to be 69357·41, giving li 10,000,000 $=664918{\cdot}41$, which differs from the value found above by only a unit in the last place. This agreement affords also a verification of the accuracy of Bessel's coefficients.

It is interesting to give the values of the successive terms in the descending series for li 100,000,000. The series is

$$\frac{e^x}{x} + \frac{e^x}{x^2} + \frac{2!e^x}{x^3} + \frac{3!e^x}{x^4} + \frac{4!e^x}{x^5} + \&c.;$$

and denoting by $[n]$ the nth term, $\frac{(n-1)!e^x}{x^n}$, then the values of the terms are as follows:—

$$e^x = 100{,}000{,}000$$

[1]	5428681·02,	[13]	1·70,
[2]	294705·78,	[14]	1·20,
[3]	31997·27,	[15]	0·91,
[4]	5211·09,	[16]	0·74,
[5]	1131·57,	[17]	0·65,
[6]	307·15,	[18]	0·60,
[7]	100·04,	[19]	0·58,
[8]	38·02,	[20]	0·60,
[9]	16·52,	[21]	0·65,
[10]	8·07,	[22]	0·74,
[11]	4·38,	[23]	0·89,
[12]	2·62,		&c.

The least term is $\frac{18!e^x}{x^{19}}$, which $=0{\cdot}58$; and the sum of the terms preceding this term $=5{,}762{,}209{\cdot}33$, which differs from the correct value by only 0·05.

When $e^x=10{,}000{,}000$, the least term is $\frac{15!e^x}{x^{16}}$, which $=0{\cdot}63$; and the sum of the preceding terms $=664917{\cdot}92$, which differs from the correct value by 0·5.

On the Calculation of Riemann's Formula.

Riemann's formula is

$$\operatorname{li} x - \tfrac{1}{2}\operatorname{li} x^{\frac{1}{2}} - \tfrac{1}{3}\operatorname{li} x^{\frac{1}{3}} - \tfrac{1}{5}\operatorname{li} x^{\frac{1}{5}} + \tfrac{1}{6}\operatorname{li} x^{\frac{1}{6}} - \tfrac{1}{7}\operatorname{li} x^{\frac{1}{7}} + \tfrac{1}{10}\operatorname{li} x^{\frac{1}{10}} - \tfrac{1}{11}\operatorname{li} x^{\frac{1}{11}} - \dots$$

in which the general term is $\frac{1}{n}\operatorname{li} x^{\frac{1}{n}}$, where n denotes any number not divisible by a squared factor, that is to say, any number of the form $abc\dots$ where $a, b, c, \dots$ are different primes. The sign of the term is positive when the number of the prime factors a, b, c is even, and negative when the number is uneven.

The first term $\operatorname{li} x$ was calculated for Table I. (pp. 71–73) in the manner already explained. The other terms were calculated by means of Stenberg's table in the following manner.

The portion of Stenberg's table in which the arguments are greater than unity contains the values of $\operatorname{li} 10^a$ from $a=0$ to $a=3{\cdot}5$. Between $x=1$ and $x=3{\cdot}5$, differences as far as the seventh order are given.

The terms to be calculated may be written in the form

$$-\tfrac{1}{2}\operatorname{li} 10^{\frac{1}{2}\log x} - \tfrac{1}{3}\operatorname{li} 10^{\frac{1}{3}\log x} - \tfrac{1}{5}\operatorname{li} 10^{\frac{1}{5}\log x} + \tfrac{1}{6}\operatorname{li} 10^{\frac{1}{6}\log x} - \tfrac{1}{7}\operatorname{li} 10^{\frac{1}{7}\log x} + \tfrac{1}{10}\operatorname{li} 10^{\frac{1}{10}\log x} - \tfrac{1}{11}\operatorname{li} 10^{\frac{1}{11}\log x} + \dots$$

The first step was to form the values of

$$\tfrac{1}{2}\log_{10} x,\quad \tfrac{1}{3}\log_{10} x,\quad \tfrac{1}{5}\log_{10} x,\quad \tfrac{1}{6}\log_{10} x,\quad \tfrac{1}{7}\log_{10} x,\quad \tfrac{1}{10}\log_{10} x,\quad \tfrac{1}{11}\log_{10} x,$$

from $x=50{,}000$ to $x=9{,}000{,}000$ at intervals of 50,000. These were then taken as arguments, and the corresponding values of $\operatorname{li} 10^a$ were obtained by interpolation from Stenberg's table.

As examples of the work I take the extreme cases of $x=50{,}000$ and $x=9{,}000{,}000$.

In the case of $x=50{,}000$,

$\log x = 4{\cdot}69897$,	$\frac{1}{6}\log x = 0{\cdot}78316$,
$\frac{1}{2}\log x = 2{\cdot}34949$,	$\frac{1}{7}\log x = 0{\cdot}67128$,
$\frac{1}{3}\log x = 1{\cdot}56632$,	$\frac{1}{10}\log x = 0{\cdot}46990$,
$\frac{1}{5}\log x = 0{\cdot}93979$,	$\frac{1}{11}\log x = 0{\cdot}42718$;

and, by interpolation from Stenberg's tables,

$\operatorname{li} 10^{2{\cdot}34949} = 54{\cdot}601$,	$\operatorname{li} 10^{0{\cdot}78316} = 4{\cdot}261$,
$\operatorname{li} 10^{1{\cdot}56632} = 14{\cdot}974$,	$\operatorname{li} 10^{0{\cdot}67128} = 3{\cdot}439$,
$\operatorname{li} 10^{0{\cdot}93979} = 5{\cdot}586$,	$\operatorname{li} 10^{0{\cdot}46990} = 2{\cdot}118$,
	$\operatorname{li} 10^{0{\cdot}42718} = 1{\cdot}850$;

whence the values of the successive terms in Riemann's formula are

$$-27{\cdot}300,\quad -4{\cdot}991,\quad -1{\cdot}117,\quad +0{\cdot}710,\quad -0{\cdot}491,\quad +0{\cdot}212,\quad -0{\cdot}168.$$

The sum of the negative terms $=34{\cdot}067$; the sum of the positive terms $=0{\cdot}922$; whence the final result $=-33{\cdot}145$.

In the case of $x=9{,}000{,}000$,

$\log x = 6{\cdot}95424$,	$\frac{1}{6}\log x = 1{\cdot}15904$,
$\frac{1}{2}\log x = 3{\cdot}47712$,	$\frac{1}{7}\log x = 0{\cdot}99346$,
$\frac{1}{3}\log x = 2{\cdot}31808$,	$\frac{1}{10}\log x = 0{\cdot}69542$,
$\frac{1}{5}\log x = 1{\cdot}39085$,	$\frac{1}{11}\log x = 0{\cdot}63220$,

and

$$\text{li}\,10^{3\cdot47712}=442\cdot758, \qquad \text{li}\,10^{1\cdot15904}=7\cdot940,$$
$$\text{li}\,10^{2\cdot31808}=51\cdot698, \qquad \text{li}\,10^{0\cdot99346}=6\cdot100,$$
$$\text{li}\,10^{1\cdot39085}=11\cdot387, \qquad \text{li}\,10^{0\cdot69542}=3\cdot609,$$
$$\text{li}\,10^{0\cdot63220}=3\cdot170;$$

whence the values of the terms are

$$-221\cdot379, \quad -17\cdot233, \quad -2\cdot277, \quad +1\cdot323, \quad -0\cdot871, \quad +0\cdot361, \quad -0\cdot288.$$

The sum of the negative terms $=242\cdot048$; the sum of the positive terms $=1\cdot684$; whence the final result $=-240\cdot364$.

The values of the terms

$$-\tfrac{1}{2}\,\text{li}\,x^{\frac{1}{2}}-\tfrac{1}{3}\,\text{li}\,x^{\frac{1}{3}}-\tfrac{1}{5}\,\text{li}\,x^{\frac{1}{5}}+\tfrac{1}{6}\,\text{li}\,x^{\frac{1}{6}}\ldots-\tfrac{1}{11}\,\text{li}\,x^{\frac{1}{11}}$$

were calculated throughout in this manner, and the results verified by differences. It will be noticed that the value of the last term included, viz. $\frac{1}{11}\,\text{li}\,x^{\frac{1}{11}}$, is $0\cdot168$ for $x=50{,}000$ and $0\cdot288$ for $x=9{,}000{,}000$. By stopping therefore at this term in the calculation of the formula we obtain results which, though not necessarily true to the nearest unit, are probably never so much as a unit in error except by contraction.

In order to examine the effects of the subsequent portion of the series, the values of the next ten terms, viz.

$$-\tfrac{1}{13}\,\text{li}\,x^{\frac{1}{13}}+\tfrac{1}{14}\,\text{li}\,x^{\frac{1}{14}}+\tfrac{1}{15}\,\text{li}\,x^{\frac{1}{15}}-\tfrac{1}{17}\,\text{li}\,x^{\frac{1}{17}}-\tfrac{1}{19}\,\text{li}\,x^{\frac{1}{19}}$$
$$+\tfrac{1}{21}\,\text{li}\,x^{\frac{1}{21}}+\tfrac{1}{22}\,\text{li}\,x^{\frac{1}{22}}-\tfrac{1}{23}\,\text{li}\,x^{\frac{1}{23}}+\tfrac{1}{26}\,\text{li}\,x^{\frac{1}{26}}-\tfrac{1}{29}\,\text{li}\,x^{\frac{1}{29}}$$

were calculated for one value in each million, viz. for $x=1{,}000{,}000$, $x=2{,}000{,}000$, ... $x=9{,}000{,}000$, with the following results:—

x.	Negative terms.	Positive terms.
1,000,000	0·347	0·350
2,000,000	0·377	0·380
3,000,000	0·394	0·397
4,000,000	0·407	0·410
5,000,000	0·416	0·419
6,000,000	0·424	0·427
7,000,000	0·431	0·434
8,000,000	0·437	0·440
9,000,000	0·441	0·445

The total correction due to these ten terms therefore never exceeds $0\cdot004$; and it is evident that they cannot appreciably affect the accuracy of results which were only required to be correct to the nearest unit.

Continuing the calculation till the terms become insensible to the third decimal place, which occurs at the term $\frac{1}{37}\,\text{li}\,x^{\frac{1}{37}}$ for $x=1{,}000{,}000$, and at the term $\frac{1}{43}\,\text{li}\,x^{\frac{1}{43}}$ for $x=9{,}000{,}000$, we obtain the following values for the sums of the terms between $\frac{1}{29}\,\text{li}\,x^{\frac{1}{29}}$ and the insensible terms:—

x.	Negative terms.	Positive terms.
1,000,000	0·020	0·012
2,000,000	0·026	0·019
3,000,000	0·031	0·025
4,000,000	0·033	0·029
5,000,000	0·036	0·032

9,000,000	0·044	0·040

The greatest value of this additional correction is therefore $-0{\cdot}008$, and the total value of all the terms from the term $\frac{1}{13}\operatorname{li} x^{\frac{1}{13}}$ to the term that becomes insensible never exceeds $-0{\cdot}005$.

As an example of the gradual diminution of the terms I give the values of the successive terms in the case of $x=9{,}000{,}000$. The notation $[n]$ is used to denote the term $\frac{1}{n}\operatorname{li} x^{\frac{1}{n}}$.

$x=9{,}000{,}000.$

It is to be noticed, however, that the terms become insensible, not in consequence of the diminution of the coefficients, but because the point where the function $\operatorname{li} x$ vanishes is reached. After this point is passed, the terms begin to increase. The function $\operatorname{li} x$ vanishes when $x=1{\cdot}451369\ldots$; and therefore $\operatorname{li} 10^a$ vanishes when $a=0{\cdot}161777\ldots$ As we approach this value as argument the values of the successive terms in Riemann's formula diminish, but if we continue the calculation further they increase at first and then diminish to zero very slowly.

The following table shows the values of the terms from $\frac{1}{47}\,\mathrm{li}\,x^{\frac{1}{47}}$ to $\frac{1}{97}\,\mathrm{li}\,x^{\frac{1}{97}}$ for $x=9{,}000{,}000$, and forms a continuation of the series of values just given. It will be observed that, as the function $\mathrm{li}\,x$ changes sign when $x=1{\cdot}451369\ldots$ and is negative for arguments less than this quantity, the values of the 'negative' terms (*i. e.* the terms occurring with negative coefficients in Riemann's formula) are positive, and those of the 'positive' terms negative.

$x=9{,}000{,}000.$

Up to this point the terms are still increasing, though so slowly that for some distance their values are nearly constant to three places of decimals. The following table, which contains the numerical values of selected terms separated by intervals of about 100, serves to show the extreme slowness with which the terms diminish after passing their maximum:—

[101]	0·011	[601]	0·005
[201]	0·009	[701]	0·004
[301]	0·008	[802]	0·004
[401]	0·007	[901]	0·004
[501]	0·006	[1001]	0·003

As the value of Riemann's series was only required to the nearest unit, it appeared therefore that it was unnecessary to take account of the terms beyond $\frac{1}{11}\,\mathrm{li}\,x^{\frac{1}{11}}$, and the numbers given in Table V. (pp. 84–86) are those derived from the calculation of the series as far as this term only. The preceding results also show how laborious would be the calculation of the series term by term if greater accuracy were attempted.

The manner in which $\mathrm{li}\,10{,}000{,}000$ and $\mathrm{li}\,100{,}000{,}000$ were calculated has been already explained on pp. 97 and 98. The other terms occurring in Riemann's formula were calculated for $x=10{,}000{,}000$ and $x=100{,}000{,}000$ by interpolation from Stenberg's table, except in the case of $\mathrm{li}\,x^{\frac{1}{4}}$ for $x=100{,}000{,}000$, which $=\mathrm{li}\,10{,}000=\mathrm{li}\,10^4$, and is therefore beyond the range of

the table. The value of li 10,000 is, however, given by Bessel (*Abhandlungen*, vol. ii. p. 339), and his value was used.

I give below the values of the terms in the case of $x=100{,}000{,}000$ as far as the point where the minimum term is reached; of course the subsequent terms increase and then slowly diminish, as in the case of $x=9{,}000{,}000$.

$x=100{,}000{,}000.$

It is easy to see that in all cases the terms ultimately decrease to zero. This may be proved either by finding the limiting value of $\frac{\operatorname{li} x^{\frac{1}{n}}}{n}$ for $n=\infty$, which, differentiating the numerator and denominator,

$$=\text{the limit of } -\frac{x^{\frac{1}{n}}}{n}=0;$$

or by considering the series which defines $\operatorname{li} x$; for the term which becomes infinite as n increases is $\log\log x^{\frac{1}{n}}$, and

$$\frac{1}{n}\log\log x^{\frac{1}{n}}=\frac{1}{n}\left(\log\frac{1}{n}+\log\log x\right),$$

which is zero when n is infinite.
